

Machine Learning

Problem formulation

Example: Predicting movie ratings

User rates movies using one to five stars

Machine Learning

Content-based recommendations

Content-based recommender systems

treat each as a seperate linear regression problem

 \Rightarrow For each user j, learn a parameter $\theta^{(j)} \in \mathbb{R}^3$. Predict user j as rating movie $(\theta W) h h x^{(i)}$

$$\chi^{(3)} = \begin{bmatrix} 0.99 \\ 0 \end{bmatrix} \longleftrightarrow \Theta^{(1)} = \begin{bmatrix} 0 \\ \frac{5}{0} \end{bmatrix} \quad (\Theta^{(1)})^{T} \chi^{(3)} = 5 \times 0.99$$

$$= 4.95$$

Problem formulation

- $\rightarrow r(i,j) = 1$ if user j has rated movie i (0 otherwise)
- $\rightarrow y^{(i,j)} = rating$ by user j on movie i (if defined)
- $\rightarrow \theta^{(j)}$ = parameter vector for user j
- $\Rightarrow x^{(i)}$ = feature vector for movie i
- \rightarrow For user j, movie i, predicted rating:
- $\underline{m^{(j)}}$ = no. of movies rated by user j

To learn $\theta^{(j)}$:

n is the number of features
$$\frac{\lambda}{\lambda} + \frac{\lambda}{\lambda} = \frac{\lambda}{\lambda} \left(\frac{\delta(i)}{\lambda} \right)^{2}$$

$$\frac{Q_{(i)}}{Q_{(i)}} = \frac{5}{1} \sum_{i: \iota(i,i)=1}^{N} \frac{(Q_{(i)})_{i}(x_{(i)}) - A_{(i,i)}}{(Q_{(i)})_{i}(x_{(i)})} + \frac{5}{1} \sum_{i=1}^{N} (Q_{(i)}^{k})_{i}$$

sum of all the movies that user j has rated

Optimization objective:

To learn $\theta^{(j)}$ (parameter for user j):

$$\implies \min_{\theta^{(j)}} \frac{1}{2} \sum_{i:r(i,j)=1} \left((\theta^{(j)})^T x^{(i)} - y^{(i,j)} \right)^2 + \frac{\lambda}{2} \sum_{k=1}^n (\theta_k^{(j)})^2$$

To learn $\theta^{(1)}, \theta^{(2)}, \dots, \theta^{(n_u)}$:

$$\min_{\theta^{(1)}, \dots, \theta^{(n_u)}} \frac{1}{2} \sum_{j=1}^{n_u} \sum_{i: r(i,j)=1} \left((\theta^{(j)})^T x^{(i)} - y^{(i,j)} \right)^2 + \frac{\lambda}{2} \sum_{j=1}^{n_u} \sum_{k=1}^{n} (\theta_k^{(j)})^2$$

Optimization algorithm:

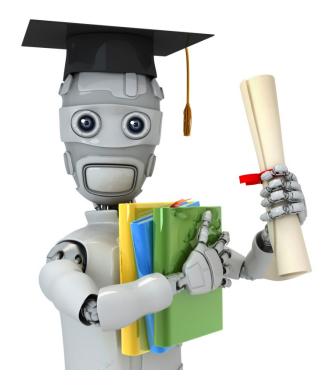

$$\min_{\theta^{(1)}, \dots, \theta^{(n_u)}} \frac{1}{2} \sum_{j=1}^{n_u} \sum_{i: r(i,j)=1} \left((\theta^{(j)})^T x^{(i)} - y^{(i,j)} \right)^2 + \frac{\lambda}{2} \sum_{j=1}^{n_u} \sum_{k=1}^{n_u} (\theta_k^{(j)})^2$$

Gradient descent update:

$$\theta_k^{(j)} := \theta_k^{(j)} - \alpha \sum_{i:r(i,j)=1} ((\theta^{(j)})^T x^{(i)} - y^{(i,j)}) x_k^{(i)} \text{ (for } k = 0)$$

$$\theta_k^{(j)} := \theta_k^{(j)} - \alpha \left(\sum_{i:r(i,j)=1} ((\theta^{(j)})^T x^{(i)} - y^{(i,j)}) x_k^{(i)} + \lambda \theta_k^{(j)} \right) \text{ (for } k \neq 0)$$

Optimization algorithm

Given $\underline{\theta^{(1)}, \dots, \theta^{(n_u)}}$, to learn $\underline{x^{(i)}}$:

Given $\theta^{(1)}, \dots, \theta^{(n_u)}$, to learn $x^{(1)}, \dots, x^{(n_m)}$:

$$\min_{x^{(1)},...,x^{(n_m)}} \frac{1}{2} \sum_{i=1}^{n_m} \sum_{j:r(i,j)=1} ((\theta^{(j)})^T x^{(i)} - y^{(i,j)})^2 + \frac{\lambda}{2} \sum_{i=1}^{n_m} \sum_{k=1}^n (x_k^{(i)})^2$$

Collaborative filtering

Given
$$\underline{x^{(1)},\dots,x^{(n_m)}}$$
 (and movie ratings), can estimate $\underline{\theta^{(1)},\dots,\theta^{(n_u)}}$

Given
$$\theta^{(1)},\ldots,\theta^{(n_u)}$$
, can estimate $x^{(1)},\ldots,x^{(n_m)}$

Machine Learning

Collaborative filtering algorithm

Collaborative filtering optimization objective

Cives
$$m^{(1)}$$
 and $m^{(n_m)}$ setting to $O^{(1)}$

$$\Rightarrow \text{Given } x^{(1)}, \dots, \underbrace{x^{(n_m)}, \text{ estimate } \theta^{(1)}, \dots, \theta^{(n_u)}}_{1 \sum_{i=1}^{n_u} \sum_{(i,j) \in T} x^{(i)}, \dots, y^{(i,j)}}_{(i,j) \in T}$$

$$= \lim_{\theta^{(1)}, \dots, \theta^{(n_u)}} \frac{1}{2} \sum_{j=1}^{u} \sum_{\substack{i: r(i,j)=1}} ((\theta^{(j)})^T x^{(i)} - y^{(i,j)})^2 + \frac{\lambda}{2} \sum_{j=1}^{u} \sum_{k=1}^{u} (\theta^{(j)}_k)^2$$

 \rightarrow Given $\theta^{(1)}, \ldots, \theta^{(n_u)}$, estimate $x^{(1)}, \ldots, x^{(n_m)}$:

$$= \lim_{x^{(1)},...,x^{(n_m)}} \frac{1}{2} \sum_{i=1}^{n_m} \sum_{\substack{j:r(i,j) = 1 \\ j:r(i,j) = 1}} ((\theta^{(j)})^T x^{(i)} - y^{(i,j)})^2 + \frac{\lambda}{2} \sum_{i=1}^{n_m} \sum_{k=1}^{n} (x_k^{(i)})^2$$

Minimizing $x^{(1)}, \dots, x^{(n_m)}$ and $\theta^{(1)}, \dots, \theta^{(n_u)}$ simultaneously:

$$x^{(1)}, \dots, x^{(n_m)}, \theta^{(1)}, \dots, \theta^{(n_u)}) = \frac{1}{2} \sum_{\substack{(i,j): r(i,j) = 1 \\ x^{(1)}, \dots, x^{(n_m)}, \theta^{(1)}, \dots, x^{(n_m)}}} ((\theta^{(j)})^T x^{(i)} - y^{(i,j)})^2 + \frac{\lambda}{2} \sum_{i=1}^{n_m} \sum_{k=1}^{n} (x_k^{(i)})^2 + \frac{\lambda}{2} \sum_{j=1}^{n_u} \sum_{k=1}^{n} (\theta_k^{(j)})^2 + \frac{\lambda}{2} \sum_{j=1}^{n_u} \sum_{k=1}^{n_u} (\theta_k^{(j)})^2 + \frac{\lambda}{2} \sum_{j=1}^{n_u} (\theta_k$$

Collaborative filtering algorithm

- \rightarrow 1. Initialize $x^{(1)}, \dots, x^{(n_m)}, \theta^{(1)}, \dots, \theta^{(n_u)}$ to small random values.
- ⇒ 2. Minimize $J(x^{(1)}, \ldots, x^{(n_m)}, \theta^{(1)}, \ldots, \theta^{(n_u)})$ using gradient descent (or an advanced optimization algorithm). E.g. for every $j = 1, \ldots, n_u, i = 1, \ldots, n_m$:

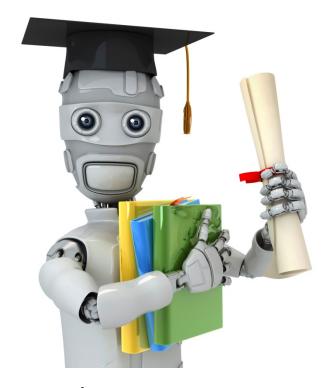

every
$$j=1,\ldots,n_u,t=1,\ldots,n_m$$
:
$$x_k^{(i)}:=x_k^{(i)}-\alpha\left(\sum_{j:r(i,j)=1}((\theta^{(j)})^Tx^{(i)}-y^{(i,j)})\theta_k^{(j)}+\lambda x_k^{(i)}\right)$$

$$\theta_k^{(j)}:=\theta_k^{(j)}-\alpha\left(\sum_{i:r(i,j)=1}((\theta^{(j)})^Tx^{(i)}-y^{(i,j)})x_k^{(i)}+\lambda \theta_k^{(j)}\right)$$
For a user with parameters θ and a movie with (learned)

3. For a user with parameters $\underline{\theta}$ and a movie with (learned) features \underline{x} , predict a star rating of $\underline{\theta}^T x$.

$$\left(\bigcirc^{(i)} \right)^{\mathsf{T}} \left(\times^{(i)} \right)$$

Finding related movies

For each product i, we learn a feature vector $x^{(i)} \in \mathbb{R}^n$.

How to find
$$\underline{\text{movies } j}$$
 related to $\underline{\text{movie } i}$?

Small $\| \mathbf{x}^{(i)} - \mathbf{x}^{(j)} \| \rightarrow \mathbf{movie} \ i$ and i are "similar"

5 most similar movies to movie i:

Find the 5 movies j with the smallest $||x^{(i)} - x^{(j)}||$.

Machine Learning
